

按著構想創建components的內容，並導入至homepage

```
import axios from 'axios';

export default function Homepage() {
  const [cardItems, setCardItems] = useState([]);

  useEffect(() => {
    const fetchCardItem = async (req, res) => {
      const apiUrl = 'https://midterm-16.herokuapp.com/api/ca';
      const { data } = await axios.get(apiUrl);
      console.log(data);
      setCardItems(data);
    };
    fetchCardItem();
  }, []);
  console.log(cardItems);
  return (
    <div>
      <Nav />
      <BigPicture />
      <IntroduceCar />
      <div className='homepageCard'>
        {cardItems.map((cardItem) => {
          return (
            <ImgCard
              key={cardItem.id}
              imgUrl={cardItem.img}
              title={cardItem.title}
              price={cardItem.price}
              type={cardItem.type}
            />
          );
        })}
      </div>
    </div>
  );
}
```
